

NAAN MUDHALVAN ARTS INTERNSHIP PROGRAM 2026

Frontend Web Development using React

COLLEGE ASSIGNMENTS SUBMISSION TRACKER

STUDENT NAME: ALMAS BEGAM.S

YEAR: II-BCA

COLLEGE CODE: 413

COLLEGE NAME: DEEN COLLEGE OF ARTS AND SCIENCE-NIDUR

DEPARTMENT: BACHELOR OF COMPUTER APPLICATION

SEMESTER: 4

ROLL NO: 24134130500122002

NMID: asanm41341324213003

DATE: 26.06.2026

TITLE: COLLEGE ASSIGNMENTS SUBMISSION TRACKER

GITHUB LINK : <https://github.com/Almasbegam/internship.git>

1.ABSTRACT

The College Assignment Submission Tracker is a React-based web application developed to help faculty efficiently manage and monitor assignment submissions across multiple subjects. The application enables faculty members to add assignments, track submission status, and identify pending or late submissions. It also provides a dashboard summarizing the total number of assignments and their current status. The project simplifies assignment management, reduces manual record-keeping, and improves overall academic monitoring through an easy-to-use and responsive interface.

2. PROBLEM STATEMENT

Many colleges still rely on manual methods such as notebooks or spreadsheets to track assignment submissions. Managing assignments for multiple subjects becomes difficult, leading to errors, missed deadlines, and inefficient monitoring. Faculty members often struggle to identify pending or late submissions quickly. This project addresses these challenges by providing a centralized system for managing assignments and viewing submission status in real time.

3. OBJECTIVES

- Develop a user-friendly assignment tracking application.
- Allow faculty to add assignments with subject and due date.
- Track assignment status as Submitted, Pending, or Late.
- Filter assignments based on subjects.
- Display a dashboard showing the number of submitted, pending, and late assignments.
- Improve efficiency in monitoring assignment submissions.

4. PROJECT SCOPE

The application provides a simple platform for managing assignment records within a college department. Faculty can create new assignments, update submission status, and filter assignments by subject. A dashboard provides a quick overview of assignment statistics.

Future Enhancements

- Student login and authentication.
- Faculty login.
- Database integration.

5. TECHNOLOGIES USED

- HTML5
- CSS3
- JavaScript (ES6)
- React Hooks (useState)
- Visual Studio Code
- Git & GitHub

6. APPLICATION FLOW

1. The faculty opens the application.
2. The dashboard displays the total number of assignments and their status summary.
3. The faculty enters the assignment title, subject, and due date.
4. Clicking the Add Assignment button stores the assignment and displays it in the assignment list.
5. Faculty can update the submission status to Submitted, Pending, or Late.
6. The dashboard updates automatically whenever the status changes.
7. Faculty can select a subject from the filter dropdown to view assignments belonging to a specific subject.
8. The application displays the filtered results for easy tracking.

7. KEY REACT CONCEPTS USED

useState

Used to store and update assignment data, form inputs, selected subject, and dashboard counts dynamically.

Components

The application is divided into reusable components such as:

- Dashboard
- Assignment Form
- Assignment List
- Filter

Props

Props are used to pass data between parent and child components.

Event Handling

React event handlers are used for:

- Adding assignments
- Updating assignment status
- Filtering assignments

Conditional Rendering

Used to display filtered assignments and update dashboard statistics dynamically.

List Rendering

The map() function is used to display all assignments in a table format.

8. EXPECTED OUTPUT

9. CHALLENGES FACED

- Managing React state efficiently while updating assignment data.
- Keeping the dashboard synchronized with assignment status changes.
- Implementing subject-based filtering without affecting the original dataset.
- Designing a responsive and user-friendly interface.
- Ensuring accurate updates when adding or modifying assignments.

10. LEARNING OUTCOMES

Through this project, I gained practical experience in:

- Building web applications using React.js.
- Understanding component-based architecture.
- Using React Hooks, especially useState.
- Managing application state effectively.
- Implementing CRUD-like operations.
- Creating responsive user interfaces with HTML and CSS.
- Working with JavaScript ES6 features.
- Using Git and GitHub for version control.

11. CONCLUSION

The College Assignment Submission Tracker successfully addresses the problem of manually tracking assignment submissions. The application provides an efficient and organized way for faculty members to manage assignments, monitor submission status, and view overall statistics through an interactive dashboard. The project demonstrates the practical use of React for building dynamic web applications and serves as a strong foundation for future enhancements such as authentication, database integration, and cloud deployment.
